

PRECIS-2 IRR Data Finalization Report

Step 1

Prepared for Aarian Bhakoo

10 September 2026

Outcome

The analysis dataset is finalized for code reorganization. All supplied source files remain unchanged in the project archive. The finalized derived dataset contains 237 paired ratings with trial and domain identifiers, three documented corrections, and three documented exclusions. Consensus scores are aligned to the same 237 observations.

Authoritative sources

- Independent ratings originate from Table 1 of **Krippendorff Rater Tables**.
- The 2x237 table uses domain-major ordering.
- Consensus ratings originate from **Consensus_Scores** and match the wide **Consensus** sheet exactly under domain-major ordering.
- Table 2 of **Krippendorff Rater Tables** matches Table 1 after converting codes 6 and 7 to missing values.
- Agreement sheets are supporting checks rather than final analytical sources.

Structure and coding

The dataset covers 24 trials and ten domains. Comparator is Domain 10; Domain 11 labels in historical sheets are copying errors. Scores 1 through 5 form the ordinal PRECIS-2 scale. Code 6 represents Missing and code 7 represents Not Applicable. Codes 6 and 7 are separate nominal categories.

Thompson (2000B), Domains 7 through 9, are excluded because separate patient- and staff-level individual measurements could not be defensibly prioritized or weighted. This leaves 237 of the possible 240 trial-domain observations.

Verified corrections

Corrections are applied only to derived data. The archived workbook is not changed.

Trial and domain	Archived A/M	Final A/M
Sagahutu (2020), Domain 4	2 / 5	5 / 2
Strasser (2008), Domain 4	5 / 4	4 / 5
Thompson (2000A), Domain 4	3 / 5	4 / 3

Here, A/M means Aarian/Merrick. Thompson (2000A), Domain 7, is already 5/6 in the archived 2x237 table and therefore requires no correction. The conflicting 6/7 appears in **Agreement (Complete)**.

Final descriptive results

Analysis	Agreements	Denominator	Agreement
Total	115	237	48.52%
Range	165	237	69.62%
Censored	110	211	52.13%
Bucketed	152	237	64.14%

Twenty-six pairs contain at least one Missing or Not Applicable rating. Their removal leaves 211 observations for censored analyses.

For bucketed agreement, the 152 agreements comprise 6 matches in the 1-2 bucket, 7 matches at score 3, 134 matches in the 4-5 bucket, 5 Missing-Missing matches, and no Not Applicable-Not Applicable matches.

Mean signed deviation from consensus is -0.014218 for Aarian and 0.028436 for Merrick across the 211 observations where both independent ratings and the consensus rating are scores 1 through 5.

Automated validation

The extraction process now stops with an error unless all of the following are true:

- The archived Table 1 contains observation identifiers 1 through 237.
- Exactly 24 trials, ten domains, and 237 unique included trial-domain pairs are reconstructed.
- All independent and consensus ratings are codes 1 through 7.
- Thompson (2000B), Domains 7 through 9, remain excluded.
- The archived values underlying each verified correction have not changed.
- Thompson (2000A), Domain 7, remains 5/6 in the authoritative table.
- The censored source table is an exact transformation of Table 1.
- The linear and wide consensus tables agree exactly.
- The censored sample contains 211 observations.
- All four accepted crude-agreement numerators and denominators are reproduced.

Files produced

- `independent_ratings_tidy.csv`
- `consensus_ratings_tidy.csv`
- `exclusions.csv`
- `verified_corrections.csv`
- `data_dictionary.csv`
- Global and domain-level descriptive reconciliation tables
- Reviewer-deviation reconciliation table

Remaining limitation

This stage finalizes the data and descriptive reconciliation targets. It does not finalize Krippendorff's alpha estimates or confidence intervals. Those must be calculated with the reorganized statistician-approved R implementation and executed in an R-enabled environment during Step 2.
